EXECUTIVE SUMMARY

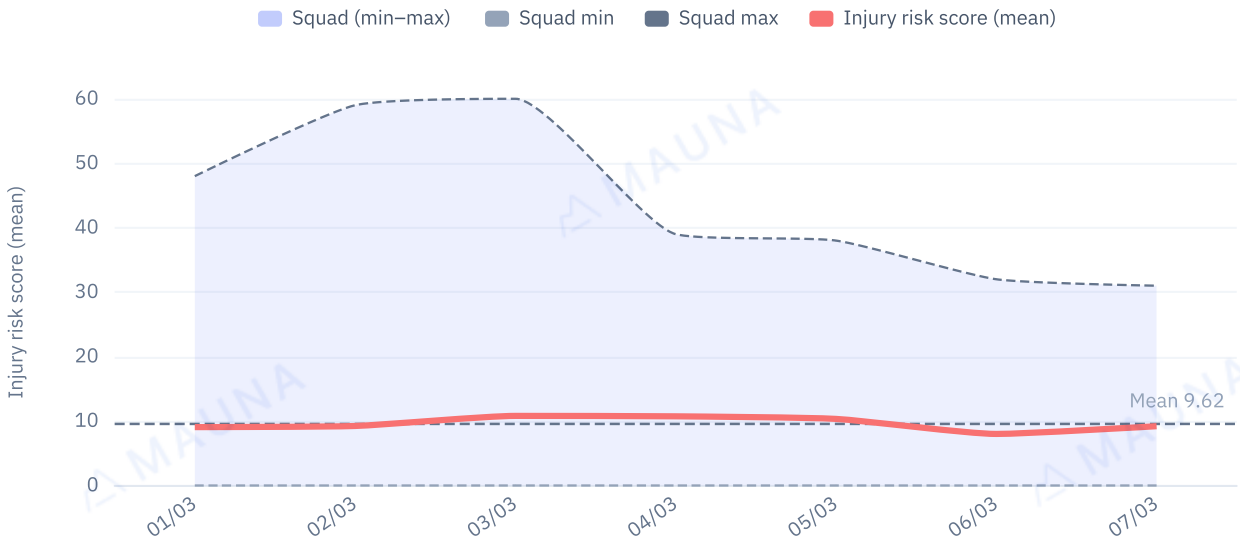

1–7 March 2026

Sunderland's wellness monitoring system captures four key subjective ratings reported daily by athletes: body soreness, energy levels, mood, and stress. During the week of 1–7 March 2026, the club recorded 92 wellness entries across the squad. Body soreness and energy ratings were logged most consistently, with additional tracking of mood and stress to provide a holistic view of athlete readiness and recovery. Pain and travel entries are also available in the system to monitor injury concerns and travel fatigue, though these were less frequently reported during this period.

EXTERNAL LOAD BY POSITION

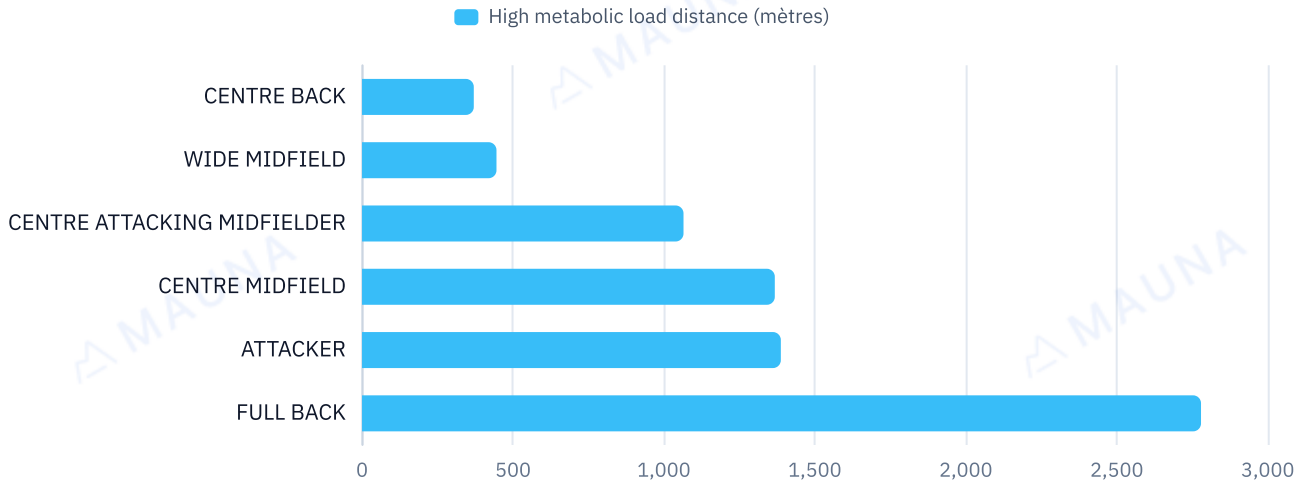

1–7 March

Full backs accumulated the highest external load across all GPS metrics during the week, followed by attackers and centre midfielders. Centre backs recorded the lowest volumes in distance and high-speed running, consistent with positional demands.

SUBJECTIVE WELLNESS – RADAR PROFILES

25 Feb – 7 Mar

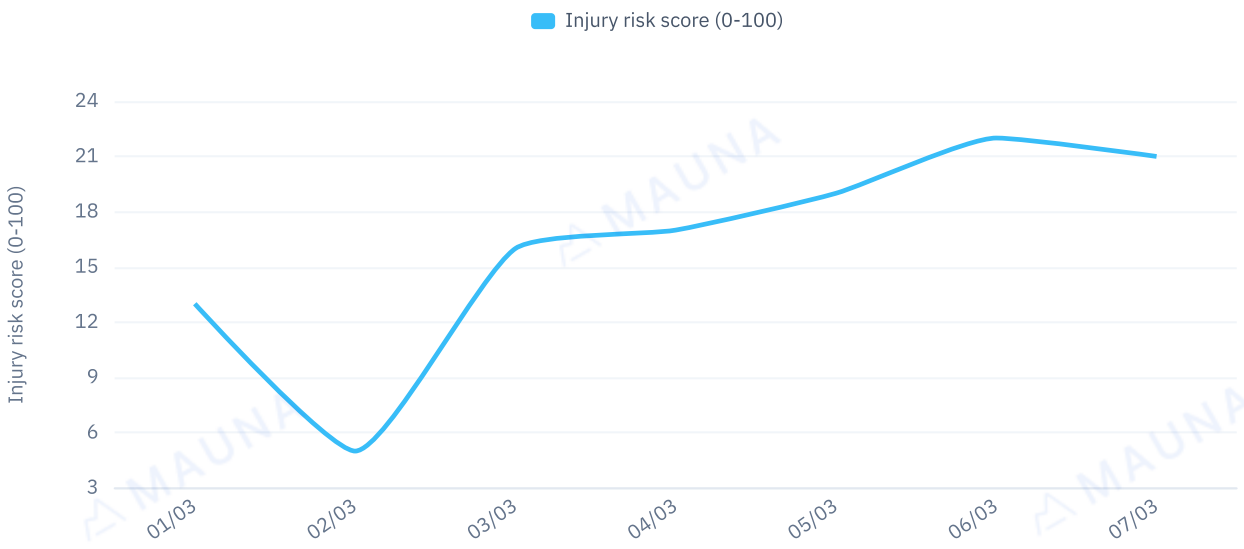

Wellness radar profiles show average ratings for body soreness and energy over the extended period (25 Feb – 7 Mar). Mood and stress data were not recorded during this window, so only two wellness axes are available. A bar chart is provided instead.

Body soreness and energy ratings: 1–10 scale (lower values indicate better wellness; higher values indicate greater soreness or lower energy).
